1. Introduction

This manual introduces firmware library of GD32F10x devices which are 32-bit microcontrollers based on the ARM processor.

The firmware library is a firmware function package, including program, data structure and macro definitions, all the performance features of peripherals of GD32F10x devices are involved in the package. The peripheral driving code and firmware examples on evaluation board are also included in firmware library. Users need not learn each peripherals in details and it's easy to apply a peripheral by using the firmware library. Using firmware library can greatly reduce programming time, thereby reducing development costs.

The driving code of each peripheral is concluded by a group of functions, which describes all the performance features of the peripheral. Users can drive a peripheral by a group of APIs (application programming interface), all the APIs are standardized about the code structure, function name and parameter names.

All the driving source code accord with MISRA-C:2004 standard (example files accord with extended ANSI-C standard), and will not be influenced by differences of IDEs, except the startup files which are written differently according to the IDEs.

The commonly used firmware library includes all the functions of all the peripherals, so the code size and the execution speed may not be the optimal. For most applications, users can use the library functions directly, while for the applications which are strict with the code size and execution speed, the firmware library can be used as the reference resource of how to configure a peripheral, and users adjust the code according to actual needs.

The overall structure of the firmware library user manual is shown as below:

- Rules of user manual and firmware library;
- Firmware library overview;
- Functions and registers descriptions of firmware library.

1.1.2. Naming rules

The firmware library naming rules are shown as below:

- The name of sourcefile and header file are started with “gd32f10x_”, such as: gd32f10x_adc.h;
- The constants used only in one file should be defined in the used file; the constants used in many files should be defined in corresponding header file. All the constants are written in uppercase of English letters;
- Registers are handled as constants. The naming of them are written in uppercase of English letters. In most cases, register names are shortened accord with the user manual;
- Variables are written in lowercase, when concluded by several words, underlines should be adapted among words;
- The naming of peripheral functions are started with the peripheral abbreviation added with an underline, when the function name is concluded by several words, underlines should be adapted among words, and all the peripheral functions are written in lowercase.

Select files

Open “Examples” folder, select the module to be tested, such as SPI, open “SPI” folder, select an example of SPI, such as “SPI_master_transmit_slave_receive_interrupt”, shown as below:

Figure 2-2. Select peripheral example files

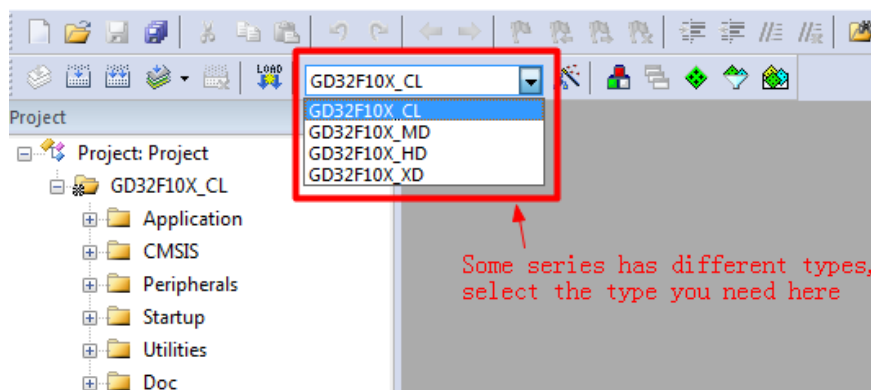

Copy files

Open “Template” folder, keep the folders of “IAR_project” and “Keil_project”, and delete the other files, then copy all the files in “SPI_master_transmit_slave_receive_interrupt” folder to the “Template” subfolder, shown as below:

Figure 2-3. Copy the peripheral example files

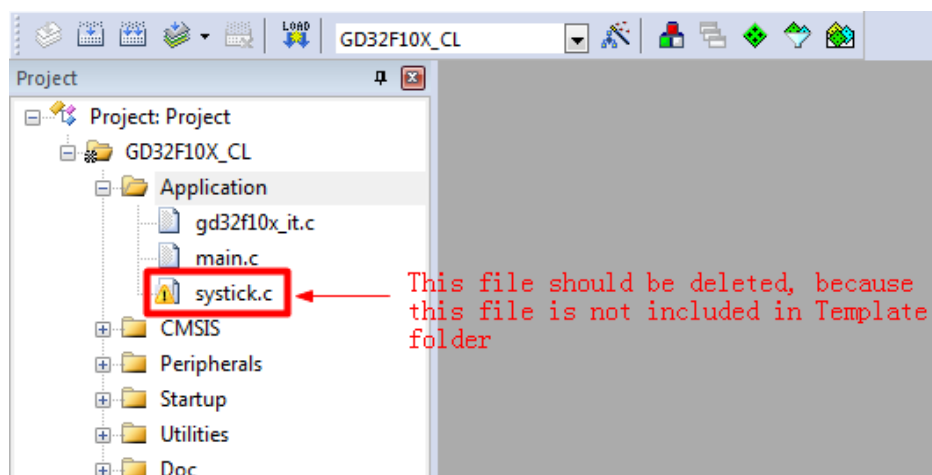

Open a project

GD provides project in Keil and IAR, users can open project in different IDEs according to their need, such as "Keil5_project", open \Template\Keil5_project\Project.uvprojx, shown as below:

Because different module and different functions adopt different files, users should add or delete the files in project according to the copied files, shown as below:

Figure 2-5. Configure project files

Compile-Debug-Download

First compile the project, if there is no error, then select the right jumper cap according to the description of readme, download the project to the target board, and there will be the phenomenon showed accord with the description of readme.
