1. Introduction

This manual introduces firmware library of GD32E11x devices which are 32-bit microcontrollers based on the ARM processor.

The firmware library is a firmware function package, including program, data structure and macro definitions, all the performance features of peripherals of GD32E11x devices are involved in the package. The peripheral driving code and firmware examples on evaluation board are also included in firmware library. Users need not learn each peripherals in details and it's easy to apply a peripheral by using the firmware library. Using firmware library can greatly reduce programming time, thereby reducing development costs.

The driving code of each peripheral is concluded by a group of functions, which describes all the performance features of the peripheral. Users can drive a peripheral by a group of APIs (application programming interface), all the APIs are standardized about the code structure, function name and parameter names.

All the driving source code accord with MISRA-C:2004 standard (example files accord with extended ANSI-C standard), and will not be influenced by differences of IDEs, except the startup files which are written differently according to the IDEs.

The commonly used firmware library includes all the functions of all the peripherals, so the code size and the execution speed may not be the optimal. For most applications, users can use the library functions directly, while for the applications which are strict with the code size and execution speed, the firmware library can be used as the reference resource of how to configure a peripheral, and users adjust the code according to actual needs.

The overall structure of the firmware library user manual is shown as below:

- Rules of user manual and firmware library;
- Firmware library overview;
- Functions and registers descriptions of firmware library.

1.1. Rules of User Manual and Firmware Library

1.1.2. Naming rules

The firmware library naming rules are shown as below:

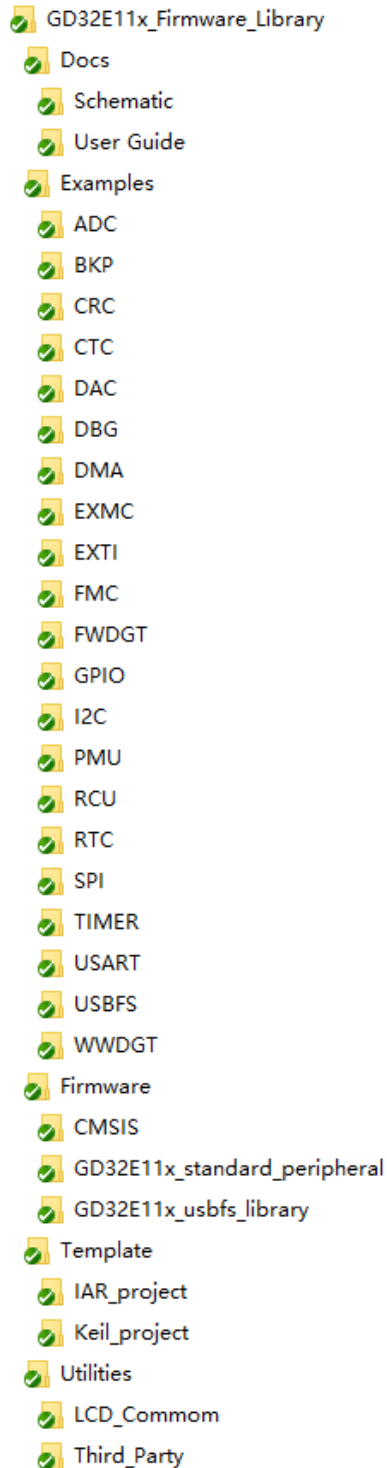

- The peripherals are shortened in XXX format, such as: ADC. More shorten information of peripherals refer to [Peripherals](#);
- The name of sourcefile and header file are started with "gd32e11x_", such as: gd32e11x_adc.h;
- The constants used only in one file should be defined in the used file; the constants used in many files should be defined in corresponding header file. All the constants are written in uppcase of English letters;
- Registers are handled as constants. The naming of them are written in uppcase of English letters. In most cases, register names are shortened accord with the user manual;
- Variables are written in lowercase, when concluded by several words, underlines should be adapted among words;
- The naming of peripheral functions are started with the peripheral abbreviation added with an underline, when the function name is concluded by several words, underlines should be adapted among words, and all the peripheral functions are written in lowercase.

2. Firmware Library Overview

2.1. File Structure of Firmware Library

GD32E11x_Firmware_Library, the file structure is shown as below:

Figure 2-1. File structure of firmware library of GD32E11x

2.1.1. Examples Folder

Examples folder, each of GD32 peripheral has a subfolder. Each subfolder contains one or more examples of the peripheral, to show how to use the peripheral correctly. Each of the example subfolder includes the files shown as below:

- `readme.txt`: the description and using guide of the example;
- `gd32e11x_libopt.h`: the header file configures all the peripherals used in the example, included by different "DEFINE" sentences (all the peripherals are enabled by default);
- `gd32e11x_it.c`: the source file include all the interrupt service routines (if no interrupt is used, then all the function bodies are empty);
- `gd32e11x_it.h`: the header file include all the prototypes of the interrupt service routines;
- `systick.c`: the source file include the precise time delay functions by using `systick`;
- `systick.h`: the header file include the prototype of the precise time delay functions by using `systick`;
- `main.c`: example code. Note: all the examples are not influenced by software IDEs.

2.1.2. Firmware Folder

Firmware folder includes all the subfolder and files which are the core part of the firmware:

- CMSIS subfolder includes the Cortex M4 kernel support files, the startup file based on the Cortex M4 kernel processor, the global header file of GD32E11x and system configuration file;
- GD32E11x_standard_peripheral subfolder:
 - Include subfolder includes all the header files of firmware library, users need not modify this folder;
 - Source subfolder includes all the source files of firmware library, users need not modify this folder;
- GD32E11x_usbfs_library subfolder includes all the related files about USBFS peripheral: users need not modify this folder;

Note: All the codes accord with MISRA-C:2004 standard, and will not be influenced by different software IDEs.

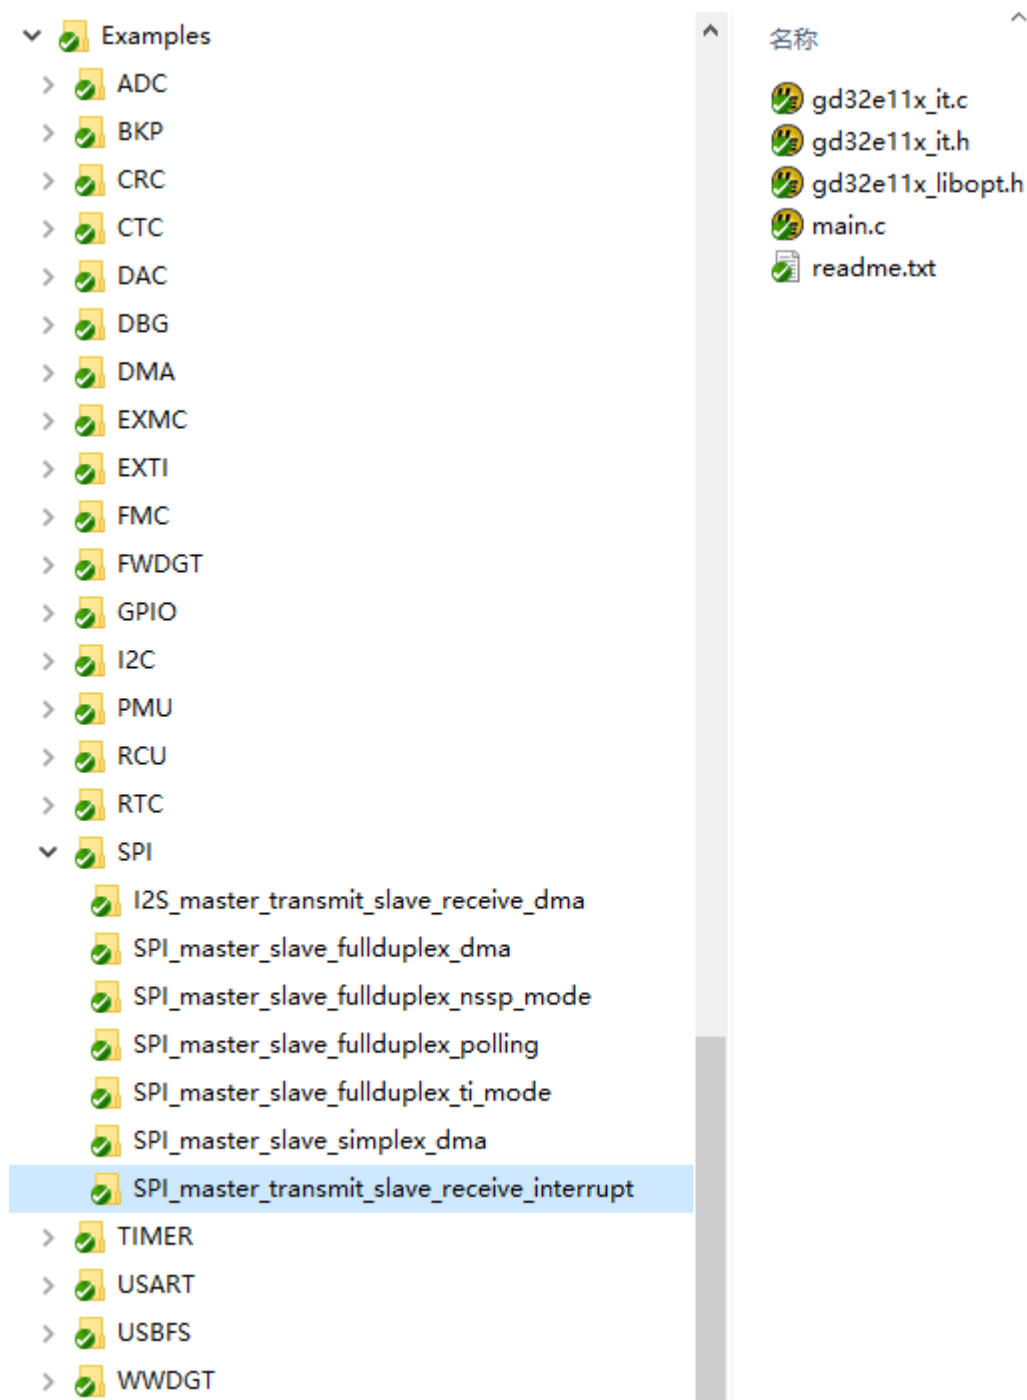

2.1.3. Template Folder

Template folder includes a simple demo of how to use LED, how to print by USART and use key to control, (IAR_project is run in IAR, and Keil_project is run in Keil4). User can use the project template to compile the formware examples, the steps are shown as below:

Select files

Open "Examples" folder, select the module to be tested, such as SPI, open "SPI" folder, select an example of SPI, such as "SPI_master_transmit_slave_receive_interrupt", shown as below:

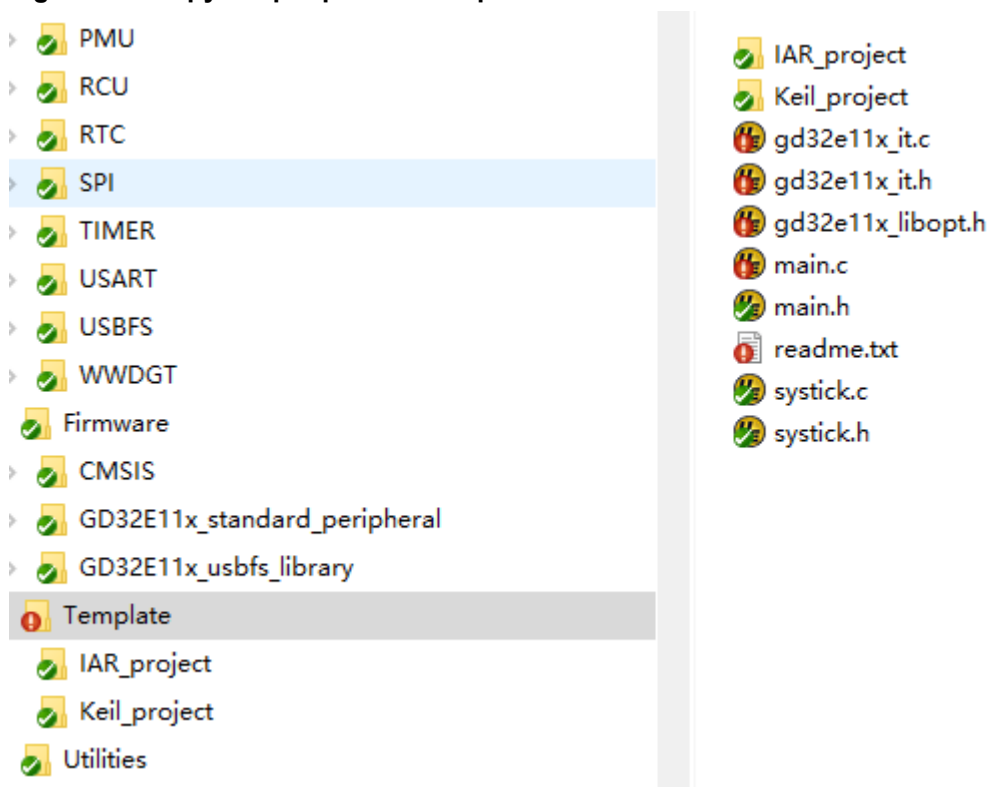

Figure 2-2. Select peripheral example files

Copy files

Open "Template" folder, keep the folders of " IAR_project" and " Keil_project", and delete the other files, then copy all the files in "SPI_master_transmit_slave_receive_interrupt" folder to the "Template" subfolder, shown as below:

Figure 2-3. Copy the peripheral example files

Open a project

GD provides project in Keil and IAR, users can open project in different IDEs according to their need, such as "Keil_project", open \Template\Keil_project\Project.uvproj, shown as below:

Figure 2-4. Open the project file

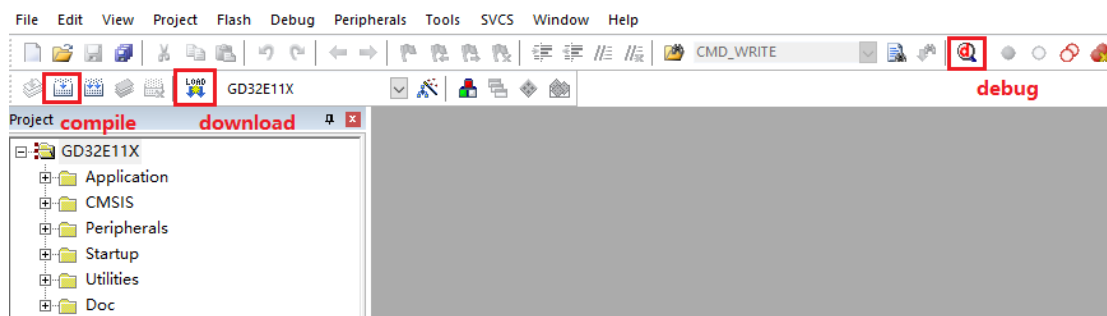

Because different module and different functions adopt different files, users should add or delete the files in project according to the copied files.

Compile-Debug-Download

First compile the project, if there is no error, then select the right jumper cap according to the

description of readme, download the project to the target board, and there will be the phenomenon showed accord with the description of readme. The usage of IDE can refer to corresponding software user guide. If users are using Keil, the figure is shown as below:

Figure 2-5. Compile-debug-download

2.1.4. Utilities Folder

Utilities folder includes files about the firmware examples on evaluation board:

outrigger	master mode control
<i>TIMER_TRI_OUT_SRC</i> <i>_RESET</i>	Reset. When the UPG bit in the TIMERx_SWEVG register is set or a reset is generated by the slave mode controller, a TRGO pulse occurs. And in the latter case, the signal on TRGO is delayed compared to the actual reset
<i>TIMER_TRI_OUT_SRC</i>	Enable. This mode is useful to start several timers at the same time or to

<code>_ENABLE</code>	control a window in which a slave timer is enabled. In this mode the master mode controller selects the counter enable signal as TRGO. There is a delay between the trigger input in pause mode and the TRGO output, except if the master-slave mode is selected.
<code>TIMER_TRI_OUT_SRC_UPDATE</code>	Update. In this mode the master mode controller selects the update event as TRGO.
<code>TIMER_TRI_OUT_SRC_CC0</code>	Capture/compare pulse. In this mode the master mode controller generates a TRGO pulse when a capture or a compare match occurred in channel 0.
<code>TIMER_TRI_OUT_SRC_O0CPRE</code>	Compare. In this mode the master mode controller selects the O0CPRE signal is used as TRGO.
<code>TIMER_TRI_OUT_SRC_O1CPRE</code>	Compare. In this mode the master mode controller selects the O1CPRE signal is used as TRGO.
<code>TIMER_TRI_OUT_SRC_O2CPRE</code>	Compare. In this mode the master mode controller selects the O2CPRE signal is used as TRGO.
